

GBM Enhanced is a unique blend developed for poultry. The synergy of the ingredients results in an optimal gut health and integrity and a positive gut microflora balance, promoting the feed digestion, the nutrient absorption and assimilation.

Many studies demonstrate, egg production and egg quality benefits from GBM Enhanced inclusion in the feed:

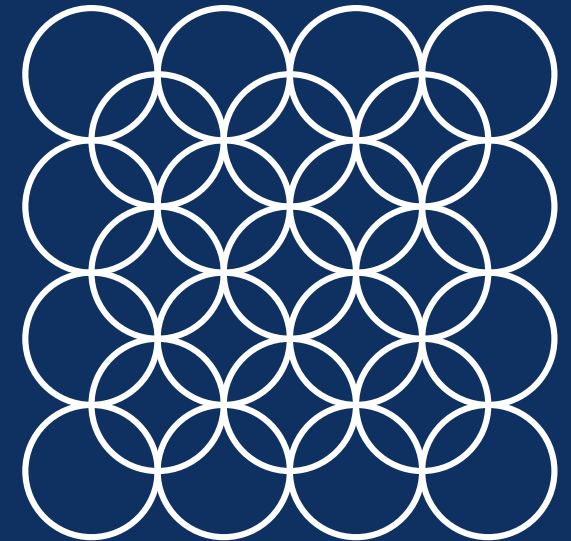

- × Increased laying rate and egg mass
- × Improved feed-to-egg-ratio
- × Improved egg-shell quality
- × Prolonged production cycle
- × Overall improved health and immunity

# Calcium Butyrate Based Supplement for Layers

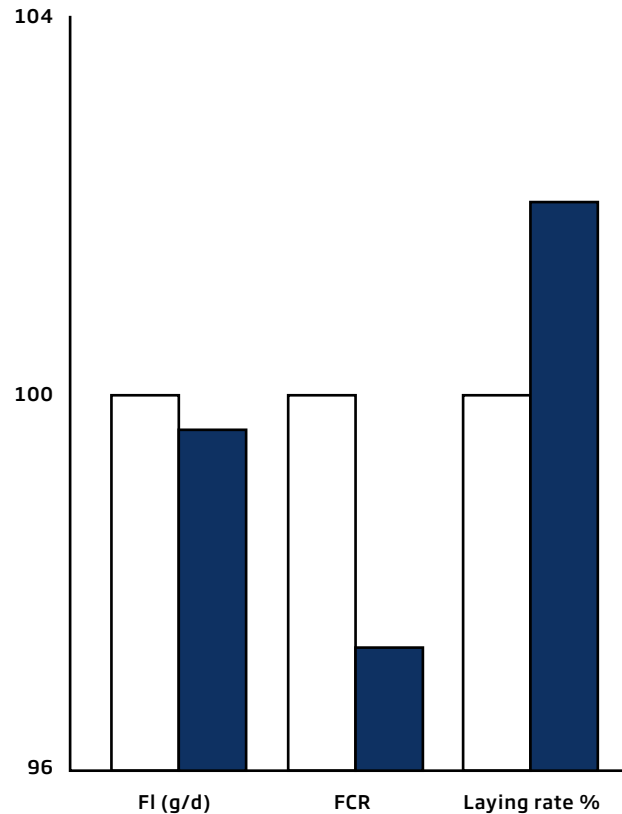

GBM Enhanced increasing:  
feed conversion - laying rate

GBM Enhanced improving:  
feed conversion rate -  
eggs/bird

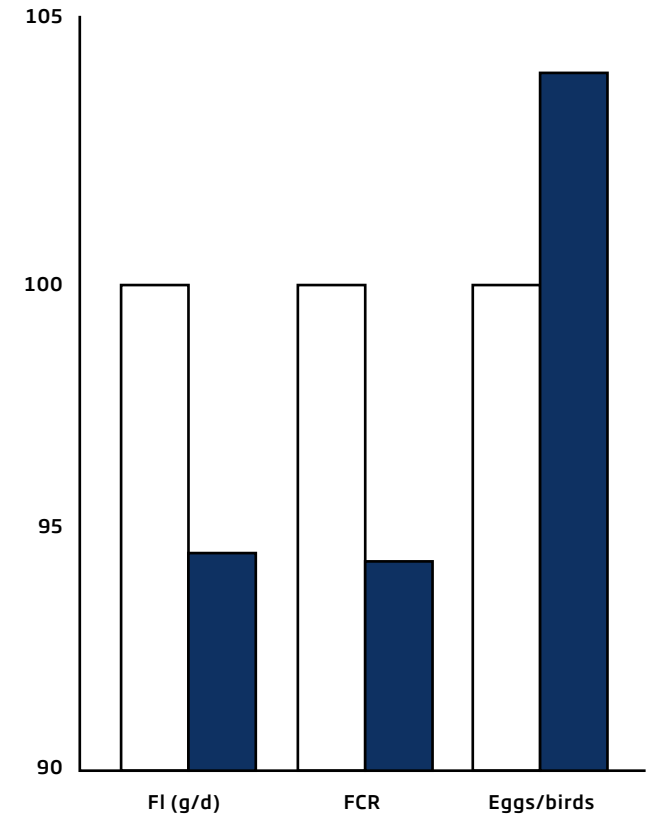

The quality of the eggshell decreases with the age of the layers. For this reason, the amount of cracked eggs at the end of the laying period may be even higher than 20% (Nys, 2001). Therefore, effective methods to improve eggshell quality are of vital importance for the commercial egg industry.

Based on a large number of trials, on average GBM Enhanced generates \*€8800 profit extra per 10000 animals, equal a ROI of 1:6

Relative %  
 Negative Control  
 GBM Enhanced

Industrial farm - Italy, 2014  
 Trial period from wk. 21 until wk. 41. Total: 125.740 birds  
 Positive control = negative control + GBM Enhanced  
 1kg/T
